A series of alloys consisting of primary mixed crystals and containing at least one transition metal as a component exhibits as a particularity that the resistance-temperature curve is curved S-form and that the resistance in the soft and in the hard state is increased by heating treatment at low temperatures and decreased by cold formation. This behavior can be attributed to the fact that at low temperatures there develops a very

DESCRIPTORS: *Glass, *Refractory materials, Clays, Photomicrography, Refractive index.

Tests are reported on refractories, especially on burnt clay, with respect to the schlieren (streak) formation they cause in the molten glass they are in contact with. Results have found satisfactory application in the selection of refractories for vat bricks and glass tank joints in planned constructions. (Author) (Materials Ceramics, TT, v. 8, no. 4)
